FULL STACK DEVELOPMENT

FULL STACK DEVELOPMENT

- It is a software framework which provides the basic structure for web applications. It includes programming language, database and a server, where
    - Server handles the requests from the client
    - Programming language is used to develop the web application
    - The database is used to store the data.
- Combining both frontend (client side) and backend (server side) of web applications is called as full stack development
- **Full Stack ➔ Front End + Back End**

Usage

- Full stack is mainly used to develop dynamic web application development and software with help of both front end and back end.

Front End

- It represents the **UI design** of the application
- It mainly focuses on the UI design

Languages of Front End

- HTML
- CSS
- Java Script

FRONT END FRAMEWORKS

- Angular JS
- React JS
- Bootstrap
- jQuery

Back End

- It represents the **code logic** of the application

Languages of Back End

- PHP
- C++, Java, C#
- Python
- Ruby
- Java Script

BACK END FRAMEWORKS

- Express (JS Based)
- Ruby on Rails (Ruby Based)
- Django (Python Based)
- Flask Web (Python Based)
- Laravel (PHP Based)
- Spring Boot (Java Based)

Databases

- Database is required for a full stack developer to store and organize project's data for a web application.

Examples

- MySQL
- PostgreSQL
- MongoDB
- Oracle, etc, …

FULL STACK WEB DEVELOPER (FULL STACK DEVELOPER)

- A full stack developer is a person who works with both front end and back end of a web application (experts in both front end and back end)
- The developer has to work on frontend, backend, database of the web applications.

- The full stack developer who can able to manage all the levels of project from the front end to back end
- The full stack developer must have in depth knowledge of all layers of development including UI design, window and web hosting services.
